3 Safety precautions

Important information

Read these operating instructions before starting the unit. They provide you with important information on the use, safety and maintenance of the units. This helps you to protect yourself and prevent damage to the unit.

Information intended to help you to avoid death, bodily harm or considerable damage to property is highlighted by the warning triangle shown here; it is imperative that this information be properly heeded.

The operating instructions are intended for trained professional electricians familiar with the safety standards of electrical technology and industrial electronics.

Store these operating instructions in an appropriate place.

The manufacturer is not liable if the information in these operating instructions is not complied with.

Safety

Components inside the units are energized with electricity during operation. For this reason, mounting and maintenance work may only be performed by professionally-trained personnel while observing the corresponding safety regulations.

The repair and replacement of components and modules may only be carried out by the manufacturer for safety reasons and due to the required compliance with the documented unit properties.

The units do not have a power switch. They are operative as soon as the operating voltage is applied.

Intended use

The units are intended for use in industrial environments. They may only be operated within the limit values stipulated by the technical data.

When configuring, installing, maintaining and testing the units, the safety and accident-prevention regulations relevant to use in each individual case must be complied with.

Trouble-free, safe operation of the units requires proper transport, storage, installation, mounting and careful operation and maintenance of the units.

Mounting and installation

The attachment options for the units were conceived in such a way as to ensure safe, reliable mounting.

The user must ensure that the attachment hardware, the unit carrier and the anchoring at the unit carrier are sufficient to securely support the unit under the given surrounding conditions.

The units are to be mounted in such a way that they can be opened up while mounted. Sufficient space for the cables must be available in the unit near the cable entries.

Sufficient space is to be kept clear around the units to ensure air circulation and to prevent the build-up of heat resulting from use. The relevant information must be heeded in the case of units ventilated by other means.

When the housing fasteners are opened, the front frame of the housing hinges out upward or downward (depending on the unit version) automatically.

Grounding

All devices are equipped with a metal housing. They comply with safety class I and require a protective earth connection. The connecting cable for the operating voltage must contain a protective earth wire of a sufficient cross section (DIN VDE 0106 part 1, DIN VDE 0411 part 1).

EMC measures

The devices comply with the EU Directive 2004/108/EC (EMC Directive) and provide the required interference immunity. Observe the following when connecting the operating voltage and data cables:

Use shielded data cables.

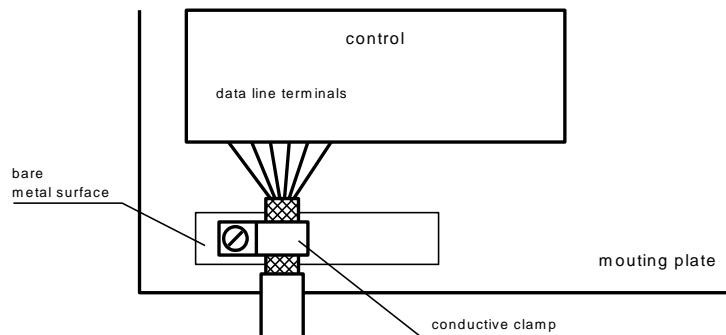

The data and operating voltage cables must be laid separately. They may not be laid together with heavy-current cables or other interference-producing cables.

The cable thickness must be properly assessed (DIN VDE 0100 Part 540).

The cable lengths inside the units are to be kept as short as possible to prevent interference. This applies especially to unshielded operating voltage cables. Shielded cables are also to be kept short due to any interference which might be emitted by the shielding.

Neither excessively long cables nor cable loops may be placed inside the units.

The connection of the cable shielding to the functional ground (PE) must be as short and low-impedance as possible. It should be made directly to the mounting plate over a large area with a conductive clip:

The cable shielding is to be connected at both cable ends. If equipotential bonding currents are expected due to the cable arrangement, electrical isolation is to be performed on one side. In this case, capacitive connection (approx. $0.1\mu\text{F}/600\text{ V AC}$) of the shielding on the isolated side must occur.

Disposal

Units or unit parts which are no longer needed are to be disposed of in accordance with the regulations in effect in your country.

4 Unit description

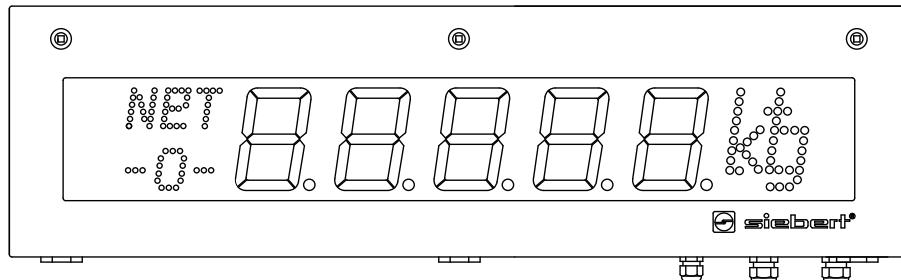

Model designation

This manual applies to units with the following model designation (x = the 'x's in the model designation indicate the size and design of the units (see Chapter 9):

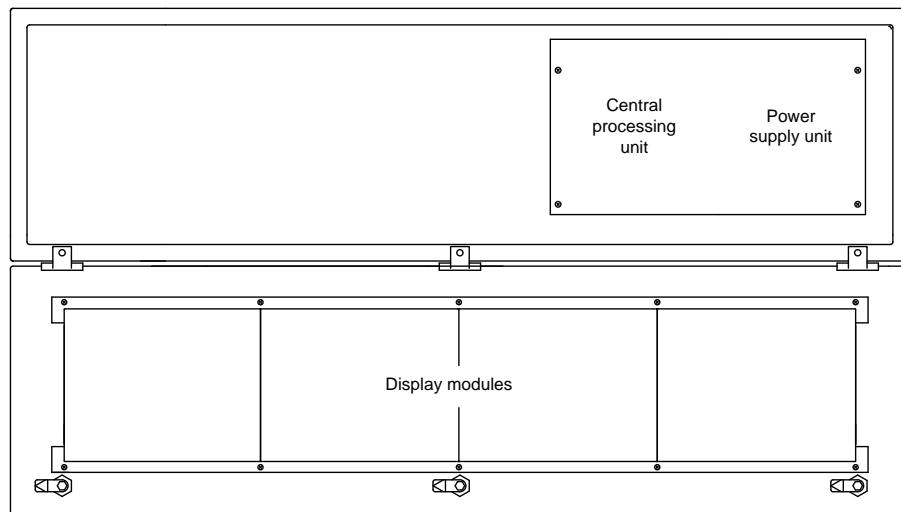

S302-xx/xx/xx-xxx/xx-xR	Data protocol Arpège
S302-xx/xx/xx-xxx/xx-xZ	Data protocol Bizerba
S302-xx/xx/xx-xxx/xx-xT	Data protocol Mettler-Toledo
S302-xx/xx/xx-xxx/xx-xL	Data protocol Phoenix Contact
S302-xx/xx/xx-xxx/xx-xE	Data protocol Precia-Molen
S302-xx/xx/xx-xxx/xx-xP	Data protocol Sartorius
S302-xx/xx/xx-xxx/xx-xC	Data protocol Schenck
S302-xx/xx/xx-xxx/xx-xM	Data protocol Siemens Siwarex
S302-xx/xx/xx-xxx/xx-Sx	Interface RS485/RS232
S302-xx/xx/xx-xxx/xx-Tx	Interface TTY 20mA/RS232

Unit construction

The following figure shows model type S302-W5/10/xx-xxx/xx-xx as example for the other model types. The front frame of the housing is locked with quick-action releases. When opening the unit the front frame hinges downward.

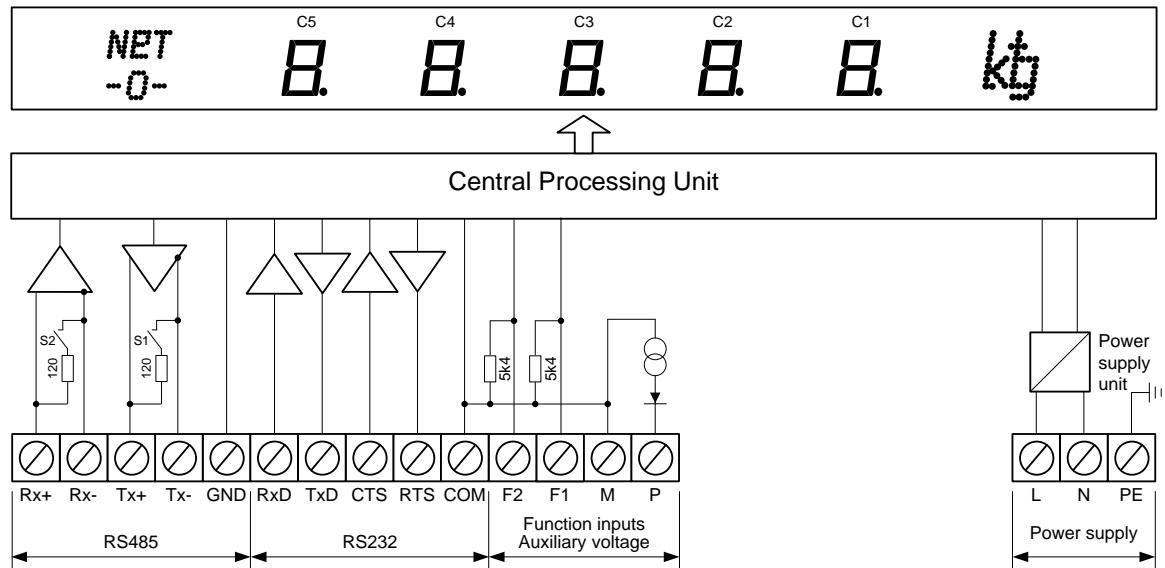

The following figure shows the unit when open.

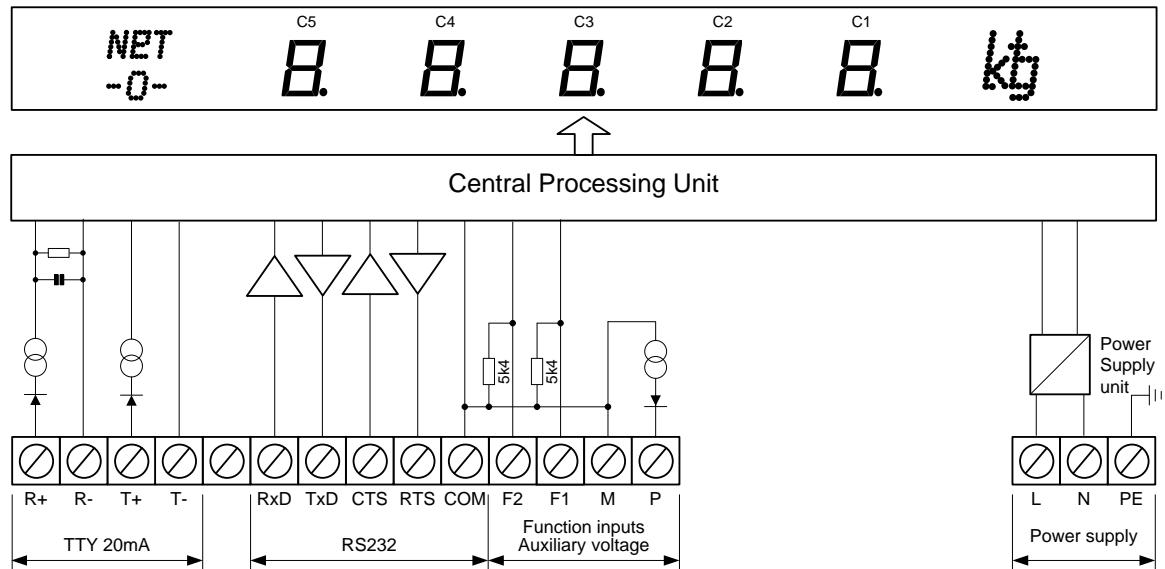

Units with double-sided display show the same information on the front and on the rear side.

Principle circuit diagram

Units with interface RS485/RS232 (S302-xx/xx/xx-xxx/xx-Sx)

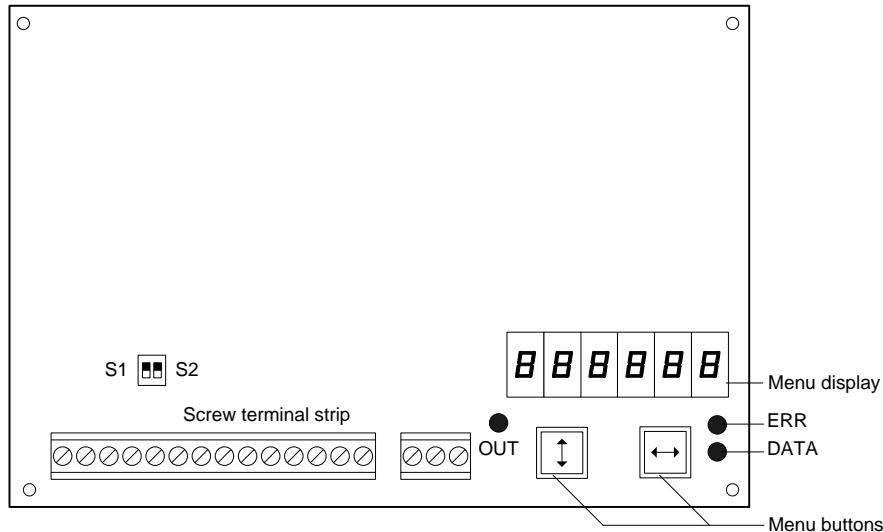

Units with interface TTY 20mA/RS232 (S302-xx/xx/xx-xxx/xx-Tx)

Central Processing Unit

The following figure shows the Central Processing Unit, located in the lower part of the housing.

Switches S1/S2 only S302-xx/xx/xx-xxx/xx-Sx
 Three-pole screw-type terminal strip without function

Serial Interface

The serial interface is located on the screw-type terminal strip of the control computer. Depending on the unit version it has the following formats:

RS485 and RS232 (S302-xx/xx/xx-xxx/xx-Sx)
 TTY 20mA and RS232 (S302-xx/xx/xx-xxx/xx-Tx)

The type of interface format is set in menu item 1 (see Chapter 6).

Preferably, the interfaces RS485 or TTY 20 mA are to be used for activation unless otherwise defined by the weighing computer. They are galvanically isolated from all other electric circuits and provide optimum preconditions for a reliable and safe operation of the devices due to its physical characteristics.

The switches S1 (Tx) and S2 (Rx) serve for locking the data lines of the RS485 (see Chapter 8).

Function inputs

The function inputs are located on the screw-type terminal strip of the control computer. They allow reduction in brightness and flashing of the display.

The function inputs are designed for the following signal voltages:

Signal voltage: L = -3.5...+5 V (open input = L)
 H = +18...30 V (active H), M = reference potential

Auxiliary voltage

The units supply terminal P with an auxiliary voltage galvanically isolated from the operating voltage (24 V ± 20%, max. 50 mA, M = reference potential). It can be used for supplying power to the current loop or as H signal for the function inputs.

Menu display

The parameterization of the units is carried out in a menu of the menu display (see Chapter 6). In normal mode, the menu display corresponds to the main display. For devices with more than six positions, *OnlinE* is shown in the menu display in normal operation.

Menu buttons

The menu buttons are used to control the menu (see Chapter 6).

Status indicators

The status indicators (LEDs) of the control computer have the following meaning:

DATA	Data reception
ERR	Communication error
OUT	No meaning

Power supply

The screw-type terminals for the power supply are located on the power supply unit in the bottom section of the housing. They have the following designations:

Devices for a power supply 115 V AC or 230 V AC	L, N and PE
Devices for a power supply 24 V DC	+, – and PE

Important note

The displays are output units. They show information received by the weighing computer via the serial interface but they do not determine the content of this information. The weighing computer is responsible for the content of the information. In case of interferences, faulty display etc. the parameterization of the weighing computer is to be checked and its operating instructions must be observed.

We cannot be held liable for damages due to an improper activation of the units or to modifications of the weighing computer properties (protocols, addresses, etc.).

These operating instructions do not substitute the operating instructions of the weighing computer.

5 Control

Data protocol

The weighing computer sends a data protocol containing the information to be shown to the display. This protocol may differ according to the manufacturer of the weighing computer. The S302 series therefore includes different unit versions with specific protocol evaluation:

S302-xx/xx/xx-xxx/xx-xR	Protocol evaluation Arpège
S302-xx/xx/xx-xxx/xx-xZ	Protocol evaluation Bizerba
S302-xx/xx/xx-xxx/xx-xT	Protocol evaluation Mettler-Toledo
S302-xx/xx/xx-xxx/xx-xL	Protocol evaluation Phoenix Contact
S302-xx/xx/xx-xxx/xx-xE	Protocol evaluation Precia-Molen
S302-xx/xx/xx-xxx/xx-xP	Protocol evaluation Sartorius
S302-xx/xx/xx-xxx/xx-xC	Protocol evaluation Schenck
S302-xx/xx/xx-xxx/xx-xM	Protocol evaluation Siemens Siwarex

Balance stop

If the protocol contains information on the balance stop, the dimension symbol only appears on the display when the weighing computer reports a balance stop (only units with LED dimension symbol).

Flashing

Flashing of the display can also be activated by application of the H signal to functional input F1.

For devices provided with an LRD® display flashing is not possible.

Brightness

The brightness can be reduced with an H signal on function input F2.

For units provided with a LRD® display brightness reduction is not possible.

Power-on reset

After power-on, minus signs are displayed to signalize that the unit is ready for operation. If a display test has been preselected in menu item F, it will run beforehand.

6 Parametrization

Menu

The parameterization of the devices is carried out in a menu in the menu display.

Menu operation

To start the menu, press both menu buttons simultaneously (approx. 1 sec.) until the first menu item appears in the menu display. It is now possible to navigate in the menu as follows:

Next menu item	Shortly press key [$\uparrow\downarrow$]
Page menu items forward	Press key [$\uparrow\downarrow$] long
Previous menu item	Double-click on key [$\uparrow\downarrow$]
Page menu items backward	Double-click on key [$\uparrow\downarrow$] and keep it pressed
Next setting	Shortly press key [$\leftarrow\rightarrow$]
Page settings forward	Press key [$\leftarrow\rightarrow$] long
Previous setting	Double-click on key [$\leftarrow\rightarrow$]
Page setting backward	Double-click on key [$\leftarrow\rightarrow$] and keep it pressed

To exit the menu shortly press the key [\uparrow] in menu item U. Depending on the setting in menu item U the settings made are either saved (set) or not saved (escape) or the factory settings are reset (default).

Cancelling the menu without saving the settings made is possible by pressing both menu buttons simultaneously (approx. 1 sec.). It will occur automatically if 60 seconds pass without a menu button being pressed.

Once the menu is closed, the device behaves in the same manner as when the operating voltage was applied.

In the menu mode the character Ξ appears in the main display. Control of the display is not possible in menu mode.

Menu tables

The menu differs according to the unit type (protocol evaluation). The different menus are listed in the following menu tables.

Individual menu items or settings can be suppressed in another menu item, depending on the unit version or setting.

The factory settings are marked with *.

The menu items are described in Chapter 7.

Menu table S302-xx/xx/xx-xxx/xx-xR (Arpèrge)

Menu item	Settings	Menu display
1 Serial interface	RS232	I 232
	RS485	I 485

Individual menu items or settings can be suppressed in another menu item, depending on the unit version or setting.

7 Menu items

Interface format

In menu item 1 you select between the interface formats which are available in the unit:

RS485 or RS232 (S302-xx/xx/xx-xxx/xx-Sx)
TTY 20mA or RS232 (S302-xx/xx/xx-xxx/xx-Tx)

The settings RS485 4-wire bus and RS485 2-wire bus in menu item 1 may not be used.

The configuration information in Chapter 8 has to be observed.

Preferably, the interfaces RS485 or TTY 20 mA are to be used for activation unless otherwise defined by the weighing computer. They are galvanically isolated from all other electric circuits and provide the best preconditions for a reliable and safe operation of the devices due to its physical characteristics.

In the interface format RS232, the RTS/CTS handshake is always active.

Data format, Parity, Baud rate

The interface parameters: data format, parity and baud rate, are set in menu items 2 to 4.

Protocol, Protocol reply

The protocol is selected in menu item 5.

The protocol reply is selected in menu item 6.

If setting 'Echo' is selected in menu item 6, the unit transmits the received data telegrams via the serial interface.

Character setting data telegram

If the characters to be represented in the display do not start on the first data telegram position, in menu item 7 you can set how many preceding characters have to be ignored.

Address

The weight type to be displayed (gross, net etc.) is selected in menu item 9 by setting the address.

Dimension symbols

In menu item d, a dimension symbol can be set (only for units with LED dimension symbols).

Weighing point

The weighing point to which the display is assigned can be selected in menu item P.

Time-out

In menu item t you can determine whether a time-out is effected and after which time. Time-out means that a minus sign appears on the display if the unit has not received a data telegram after a defined time.

Decimal point

You can set a decimal point in menu item A. Units with a LRD® display have no decimal points.

Leading zeros suppression

In menu item C you can set if leading zeros are to be displayed or suppressed. If leading zeros should be suppressed for units with LRD® display and fixed decimal point (e.g. self-adhesive foil), the corresponding position must be set in menu item A.

Display test

In menu item F, you can set whether a short-time display test is automatically carried out after power on.

If the setting *PLAY* is selected in menu item F, random characters are displayed. Then the control of the device is not possible.

Save settings

In menu item U the menu is quit (see Chapter 6). The settings made are either saved (set), or not saved (escape) or the factory settings are reset, depending on the setting selected in menu item U.

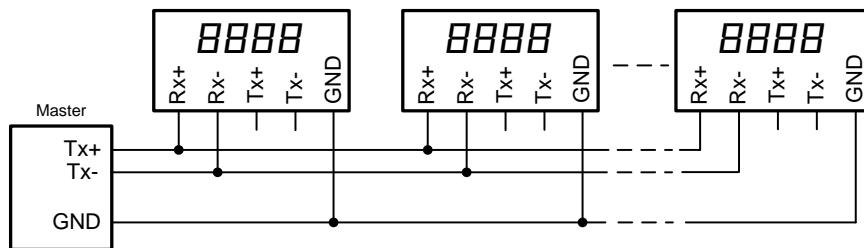

8 Notes on RS485 interface configuration

Interface RS485

The following settings have to be selected in the menu (see Chapter 6):

Menu item 1: RS485

Menu item 6: No protocol reply

Data lines

To achieve the highest possible interference immunity, the data lines of the RS485 have to be terminated on both ends. The required resistors are provided in the control computer and can be connected on the screw terminal strip with the switches S1 (Tx) and S2 (Rx) (see Chapter 4, Principle Circuit Diagram).

The polarization of the data lines must be ensured by means of the master.

For the data lines, you always have to ensure that:

Shielded twisted-pair cables of sufficiently large cross-section are used

The shielding is connected on both line ends

For the signal ground (GND) use a wire pair short-circuited on both ends in the data cable. The shielding may not be used as the signal ground

A twisted pair of conductors is used each for Tx+ and Tx- and for Rx+ and Rx-. Non-observance of this instruction causes the protective function of the twisted-pair cable to be lost.

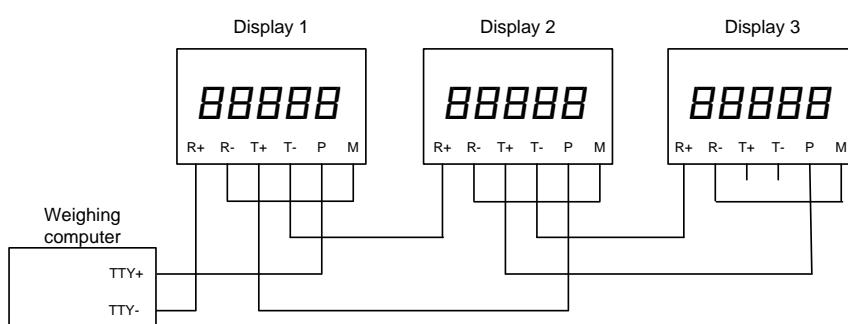

Improperly terminated data lines cause faults during data transfer.

Interface TTY 20mA

An auxiliary voltage for supply of the current loop ($24\text{ V} \pm 20\%$, max. 50 mA, M = reference potential), which is galvanically separated from the operating voltage, is supplied by the units on terminal P.

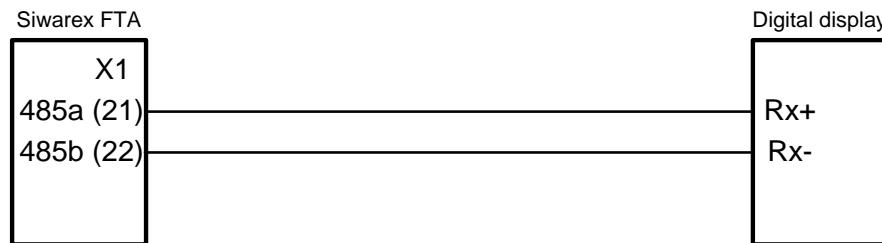

Moreover, the units send the received data telegrams via the serial interface (T+/T-). If the menu item 6 (protocol reply) is included in the menu, the setting 'Echo' has to be selected.

These properties allow the technically correct activation of several display panels as shown below:

Configuration using Siemens Siwarex

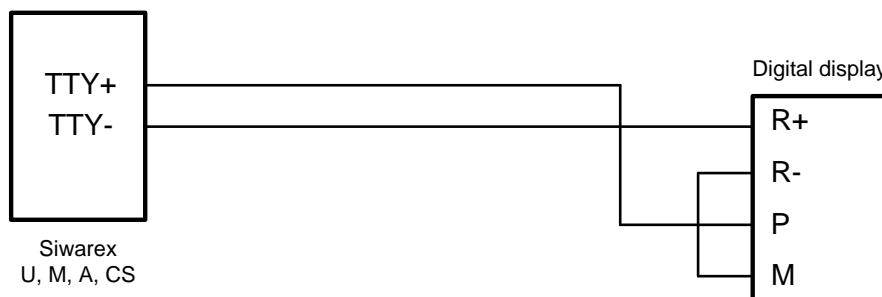

For Siwarex FTA, the unit version S302-xx/xx/xx-xxx/xx-SM is to be used. Activation is effected via the RS485 interface of the Siwarex:

In menu item 1 setting RS485 is to be selected.

The units send the received data telegrams via interface (Tx+/Tx-).

For Siwarex U, M, A and CS, the unit version S302-xx/xx/xx-xxx/xx-TM is to be used. Activation is effected via the TTY interface of the Siwarex:

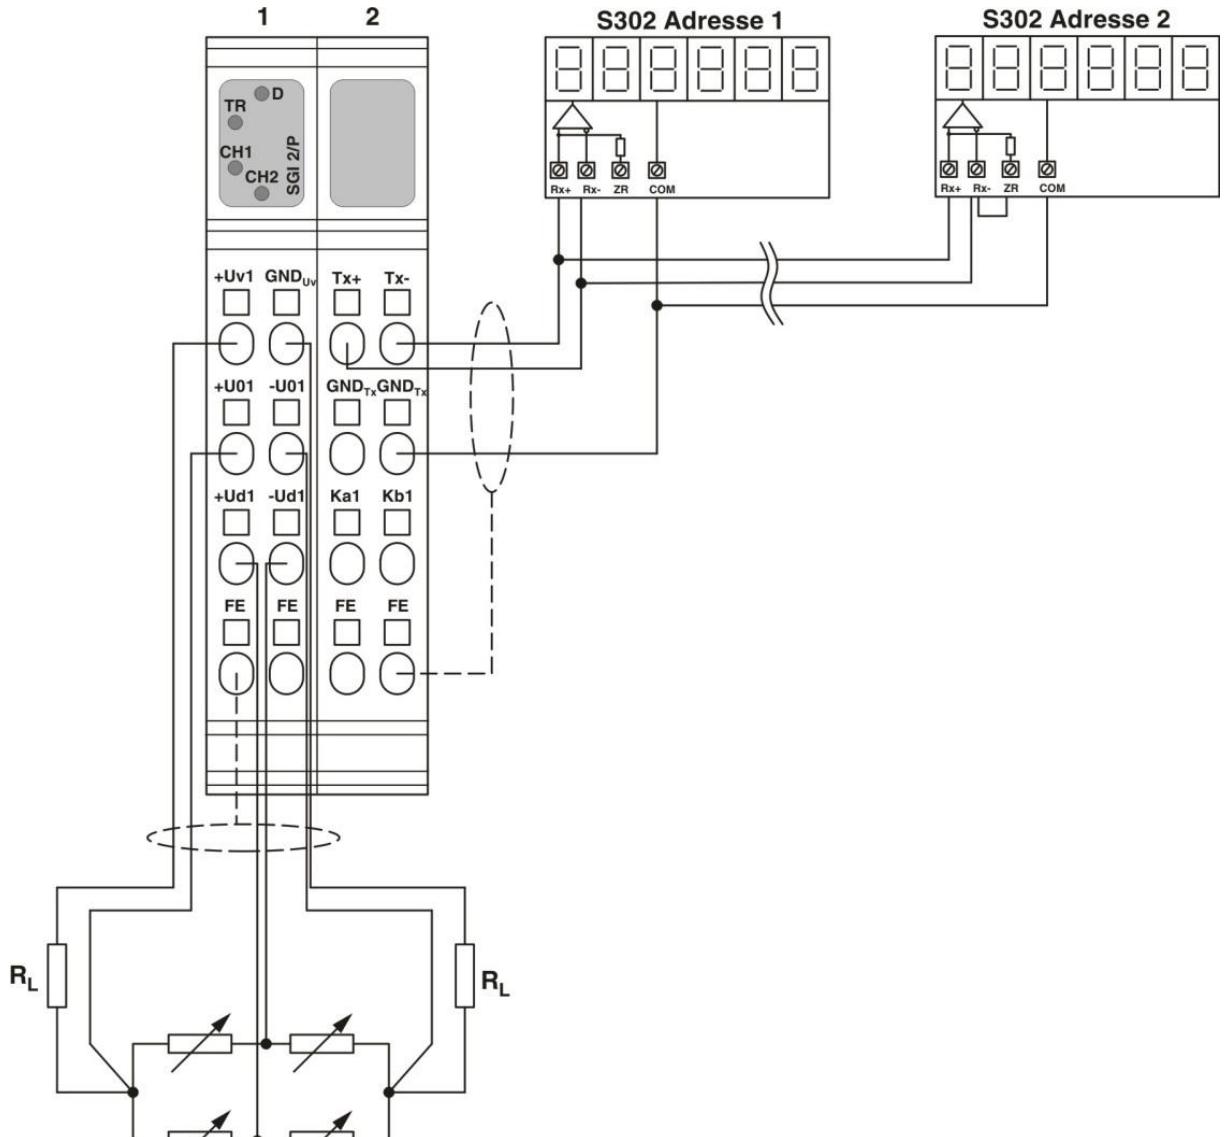

In menu item 1 setting TTY 20mA is to be selected.

The TTY interface of the Siwarex has the following terminal connections:

	Siwarex U	Siwarex M	Siwarex A	Siwarex CS
TTY+	TxD2+ (6)	TxD+ (6)	TxD+ (6)	TTY+ (10)
TTY-	TxD2- (7)	TxD- (7)	TxD- (7)	TTY- (14)

Configuration using Phoenix Contact IB IL SGI 2/P

For Phoenix Contact IB IL SGI 2/P (-PAC), the unit version S302-xx/xx/xx-xxx/xx-TL is to be used.
Activation is effected via the RS485 interface:

Adresse = address

**Units with LED dimension symbol and LED symbol -
0-NET**

5 digits, one-sided display

S302-W5/06/0x-1xx/xx-xx	approx. 17 VA
S302-W5/10/0x-1xx/xx-xx	approx. 30 VA
S302-W5/16/0x-1xx/xx-xx	approx. 104 VA
S302-W5/25/0x-1xx/xx-xx	approx. 130 VA

5 digits, double-sided display

S302-W5/06/0x-2xx/xx-xx	approx. 25 VA
S302-W5/10/0x-2xx/xx-xx	approx. 51 VA
S302-W5/16/0x-2xx/xx-xx	approx. 200 VA
S302-W5/25/0x-2xx/xx-xx	approx. 250 VA

The power consumption for the device model S302-xx/xx/0x-xxx/xx-xx is also valid for the device model S302-xx/xx/2x-xxx/xx-xx (LEDs for external use).

For units with built-in heating, the values for power consumption specified in the table increase by approx. 10 – 100 VA (exact values on request), depending on the unit size.
